Solar suitability snapshot

Modeled from rooftop and sun exposure data for this property

Planning Snapshot

Modeled from rooftop analysis.

Solar suitability: Strong candidate

Modeled capacity: Up to 44 panels

Annual solar exposure: ~1,433 sun-hours/year

Modeled annual production: ~20,570 kWh/year

Modeled monthly production vs. typical home usage

Primary graph: solar production curve

Solar production is higher in summer and lower in winter. Excess summer generation can help offset lower winter output when systems are sized to annual usage.

What this means

Based on modeled roof area, panel capacity, and sun exposure, this property appears to be a strong candidate for a solar review. A full review can confirm usable roof planes, expected production, and potential offset against annual usage.

How solar projects are often structured

" Systems are often sized around annual usage " Stronger summer output can help balance lower winter output " Some municipalities may offer property-related financing options for eligible homeowners

Why review now

" Easier to assess during roofing or exterior planning
" Layout should align with roof condition and usable planes
" Confirms whether the property is worth deeper review

What happens next

" No commitment to proceed
" No cost for the initial review

" A recent electricity bill is used to size the system correctly

This step simply confirms whether solar makes sense for this property before any decisions are made.

What a solar review involves

Free review, no commitment, and usage-based sizing with a recent electricity bill.
